```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
#  and absolute fold change more than 2

Q. Can you do the same procedure as above to plot the pathview figures for the top 5 down-regulated pathways? Yes.

```
downkeggrespathways <- rownames(keggres$less)[1:5]
downkeggresids = substr(downkeggrespathways, start=1, stop=8)
pathview(gene.data=foldchanges, pathway.id=downkeggresids, species="hsa")

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The pathway with the most significant "Entities p-value" is 'Cell Cycle'. This is identical to the KEGG results. The main factor that can cause differences between the two methods is that Reactome has a larger profile and increased specificity.
